Compiler Design

Lexical Analysis

Principles, Techniques

Lecture No.- 02

By- Venkat sir

Recap of Previous Lecture

Topic

Introduction of Compiler Design

Topic

Intermediate Code Generation phase

Topic

The role of lexical analyzer

Topic

Syntax Analysis Introduction

Topic

LR Parsing

Topics to be Covered

✓ Phases of Compilers.

Topic ① Lexical Analysis

Topic Parsing

Topic Syntax Directed Translation

Topic Intermediate code generation

Topic Code Optimization (Dataflow Analysis)

Topic Runtime Environment

Topic : Introduction of Compiler Design

Topic : Lexical Analysis

Topic : Functionality of Lexical Analysis

- ① It reads source program as stream of characters
- ② It produces tokens as output
- ③ ✓ It detects lexical errors.
4. { It eliminates comment lines
5. { It eliminates white space characters
6. { It constructs symbol table

Topic : The Role of Lexical Analyzer

Topic : The Role of Lexical Analyzer

Why to separate Lexical analysis and parsing

- Simplicity of design
- Improving compiler efficiency
- Enhancing compiler portability

Topic : The Role of Lexical Analyzer

- **Token:** Token is a sequence of characters that can be treated as a single logical entity.
- Typical tokens are,
 - 1. Identifiers
 - 2. keywords
 - 3. operators
 - 4. special symbols
 - 5. constants

Topic : Compiler Design

tokens

- ① Keywords (int, float, for) ✓
- ② Identifiers (xyz, ab) ✓
- ③ Constants (10, 2, 0, 30) ✓
- ④ Operators (+, *) ✓
- ⑤ Special symbols ([, ., {, }, ;,) ✓

{
,
;

++

+

{ Lexical
error }

①

^{k.w.}
int

xyz;

②

char

(b) (=

Compiler

Lexical error

③

char a = 'b'

Lexical error

① $\overset{id.}{\textcircled{int}} \overset{id}{\textcircled{abc}} \overset{s.s}{\textcircled{;}} \} 3 \text{ tokens}$

② $\overset{1}{a} \overset{2}{=} \overset{3}{b} \overset{4}{;} \overset{5}{*} \overset{6}{c} \overset{7}{;} \} 7 \text{ tokens}$

③ $\text{int } a, a, a ; \} \text{ no Lexical errors}$

④ $\textcircled{\text{int}} \textcircled{a} \textcircled{=} \boxed{\text{'Compiler'}} \textcircled{;} \} \text{ no lexical errors}$

Topic : Comment

Comment

- ① $\overset{1}{x} \overset{2}{=} \overset{3}{x} \overset{4}{+} \overset{5}{z}; \overset{6}{/* \text{ comment} */}$ } 6 tokens
- ② $x = /* \text{ comment} */ y + z;$ }
3. $x = y + z;$

$\text{int } \square \text{ abc};$

Comment

White Space

#Q. How many tokens are generated by the lexical analyzer, if the following program has not lexical error?

```
main()
```

```
{
```

```
int x, y;
```

```
float *gate; float z;
```

```
x = *exam* 10;
```

```
y = 20;
```

```
}
```

22 tokens

no token

no token

```
main()
```

```
{
```

```
int x, y;
```

```
float z;
```

```
x = 10;
```

```
y = 20;
```

```
}
```

#Q. Consider the C program

```
main123()  
4{  
    5int 6x 7= 810 9;  
    10x 11= 12x 13+ 14y 15+ 16z 17;  
    18}  
    * compiler Design */
```

How many tokens are identified by lexical analyzer?

18 tokens

#Q. Consider the following program segment:

```
main ()
```

```
{
```

```
    int a, b;
```

```
        a = 5 + 8 +;
```

```
        printf("%d", a);
```

```
}
```

24 tokens

The number of token present in the above program segment

[MCQ]

#Q. Which of the following is not a token in C language?

- A** Semicolon ✓
- B** Identifier ✓
- C** Keyword ✓
- D** White space

(D)

(Q) Which of the following C Program having Lexical error? 

(a) main()

```
{ int a,b;
```

```
  c = a + b;
```

} no lexical error

(b) main()

```
{ int a,a,a,a;
```

```
}
```

no L.E

(c) main()

```
{ int a,b;
```

```
  char c = "Hello";
```

```
  a = b + c;
```

```
}
```

int + string

no Lexical error

(d) none

① Tokens Generation

② Lexical error detection

#Q. Consider the following program segment:

```
main123  
4{  
    int5 a6 b7 c10 11;  
    a12 =13 5014 15;  
    b16 =17 &a18 19;  
    printf21 ("%d"22, b23);  
}
```

8 9

The number of tokens in the above C code are ____.

28 tokens

Topic : Syntax

Analysis }

Parsing

Parser

int a,b,c,d ;

Syntax

- Structure of Program statements known as syntax.

Parsing

is $W \in \text{Grammar}$?

- Checking given string is member of given grammar (or) not knowns as parsing.

Parser (or) syntax Analyzer

- It is a program that takes tokens and CFG as input and ^{Verify} tokens are member or not.
- If tokens are member parser produces parse tree as output. Otherwise syntax error is generated.

① **CFG**

② Parsing Algorithms

CFG [$A \rightarrow \alpha$]
 $\alpha \in (V+T)^*$

① Ambiguous Grammars are
 not good for Parser design.

Ex:- CFG

$$\left\{ \begin{array}{l} S \rightarrow \underline{A} \underline{B} \\ A \rightarrow a \\ B \rightarrow b \end{array} \right\}$$

$$E_x :=$$
$$E \rightarrow E + E \mid E * E \mid n$$

} NO

Ex $S \rightarrow SS | \epsilon$ } Not good for Parser

$$\underline{\underline{Ex}} \left\{ \begin{array}{l} S \rightarrow AaAb | BbBa \\ A \rightarrow \epsilon \\ B \rightarrow \epsilon \end{array} \right\}$$

Unambiguous Grammar

Suitable for Parser ✓

Topic : Parsing ALGORITHMS

- Parser (or) syntax analyzer is a deterministic pushdown automata.
- To design parser two types of algorithms exist known as
 1. Bottom up parsing algorithm.
 2. Top down parsing algorithm.

Topic : Parsing Algorithms

Pushdown Automata
(DPDA)

more powerful ✓
